Worksheet

Rohan Alexander

21 October, 2026

Team time for Assignment II, with three things to get done before you leave. Toronto teams, the assignment is due end of day Sunday 25 October.

1. Containerize the pipeline. Write a `Dockerfile` for your team's pipeline, following the demonstration and the ten rules of Nüst et al. (2020). Build it. Then clone your repo to a new folder, build and run it there, and check that the forecast it produces matches the one you committed. If you want practice first, the containerization exercises in Timbers et al. (2025) are at https://ubc-dsci.github.io/reproducible-and-trustworthy-workflows-for-data-science/lectures/100-containerization-1.html.
2. Document the repo. Add a data dictionary for your frame and your respondents file, one row per variable with the name, type, allowed values, and source, and reorganize the repo into the folder layout from the data management slides. Someone from another team should be able to find the forecast, the code that made it, and the data it used, without asking you.
3. Interpret the model. For the vote-choice model you fitted, compute average marginal effects for one predictor with `marginaleffects`, and write two sentences for the website saying what they mean in words a reader who has not seen the model would understand.
